'Youth', Heart of Darkness and 'The End of the Tether' make up Conrad's most celebrated collection of short narratives. Heart of Darkness forms its sombre centrepiece: set in the Congo of the 1890s, this haunting and widely influential Modernist masterpiece explores the limits of human experience as well as the nightmarish realities and consequences of imperialism. The Cambridge edition presents this trio of stories and Conrad's preface to the collection in forms more authoritative than any so far published. The introduction situates the stories in Conrad's publishing career, traces their sources and surveys contemporary reception. The edition includes detailed explanatory and contextual notes, a glossary of nautical terms, maps and illustrations. A textual essay and comprehensive apparatus reveal the history of each story's composition, revision and publication. This volume will allow scholars to see these familiar stories in a fresh light, by returning to Conrad's original texts. Apart from covering important areas of current interest, a major aim is to make topics of an interdisciplinary nature accessible to the non-specialist. The works in this series are addressed to advanced students and researchers in mathematics and theoretical physics. In addition, it can serve as a guide for lectures and seminars on a graduate level. The series de Gruyter Studies in Mathematics was founded ca. 30 years ago by the late Professor Heinz Bauer and Professor Peter Gabriel with the aim to establish a series of monographs and textbooks of high standard, written by scholars with an international reputation presenting current fields of research in pure and applied mathematics. While the editorial board of the Studies has changed with the years, the aspirations of the Studies are unchanged. In times of rapid growth of mathematical knowledge carefully written monographs and textbooks written by experts are needed more than ever, not least to pave the way for the next generation of mathematicians. In this sense the editorial board and the publisher of the Studies are devoted to continue the Studies as a service to the mathematical community. Please submit any book proposals to Niels Jacob. Statistical Mechanics, Kinetic Theory, and Stochastic Processes presents the statistical aspects of physics as a "living and dynamic" subject. In order to provide an elementary introduction to

kinetic theory, physical systems in which particle-particle interaction can be neglected are considered. Transport phenomena in the free-molecular flow region for gases and the transport of thermal radiation are discussed. Discrete random processes such as random walk, binomial and Poisson distributions, and throwing of dice are studied by means of the characteristic function. Comprised of 11 chapters, this book begins with an introduction to the mass point gas as well as some elementary properties of space and velocity distributions. The discussion then turns to radiation and its interaction with an atom; probability, statistics, and conditional probability; intermolecular interactions; transport phenomena; and statistical thermodynamics. Molecular systems at low densities are also considered, together with non-ideal and real gases; liquids and solids; and stochastic processes, noise, and fluctuations. In particular, the response of atoms and molecules to perturbations and scattering by crystals, liquids, and high-pressure gases are examined. This monograph will be useful for undergraduate students, practitioners, and researchers in physics. This volume contains papers of leading experts in the modern continuum theory of composite materials. The papers expose in detail the newest ideas, approaches, results and perspectives in this broadly interdisciplinary field ranging from pure and applied mathematics, mechanics, physics and materials science. The emphasis is on mathematical modelling and model analysis of the mechanical behaviour and strength of composites, including methods of predicting effective macroscopic properties (dielectric, elastic, nonlinear, inelastic, plastic and thermoplastic) from known microstructures. Contents:Effective Field Method in Mechanics of Matrix Composite Materials (S K Kanaun & V M Levin)Functional Series and Hashin-Shtrikman Type Bounds on the Effective Properties of Random Media (K Z Markov & K D Zvyatkov)Bounds for the Effective Properties of Nonlinear Composite Materials (D R S Talbot)On the Modelling of the Inelastic Thermomechanical Behaviour and the Failure of Fibre-Reinforced Composites — A Unified Approach (K P Herrmann & I Mihovsky)Modelling of Elastic and Inelastic Behaviour of Composites (O B Pedersen & B Johannesson)Random Structure Models for Composite Media and Fracture Statistics (D Jeulin) Readership: Applied mathematicians. keywords:Continuum Theory;Composite Materials;Macroscopic Properties This third edition of one of the most important and best selling textbooks in statistical physics, is a graduate level text suitable for students in physics, chemistry, and materials science. The discussion of strongly interacting condensed matter systems has been expanded. A chapter on stochastic processes has also been added with emphasis on applications of the Fokker-Planck equation. The modern theory of phase transitions occupies a central place. The chapter devoted to the renormalization group approach is largely rewritten and includes a detailed discussion of the basic concepts and examples of both exact and approximate calculations. The development of the basic tools includes a chapter on computer simulations in which both Monte Carlo method and molecular dynamics are introduced, and a section on Brownian dynamics added. The theories are applied to a number of important systems such as liquids, liquid crystals, polymers, membranes, Bose condensation, superfluidity and superconductivity. There is also an extensive treatment of interacting Fermi and Bose systems, percolation theory and disordered systems in general. Cloud Computing: Theory and Practice provides students and IT professionals with an in-depth analysis of the cloud from the ground up. The third edition updates content throughout the book while retaining the popular features and organization of the second edition. After an introduction to network-centric computing and network-centric content in Chapter One, the book is organized into four sections. Section One reviews basic concepts of

concurrency and parallel and distributed systems. Section Two presents such critical components of the cloud ecosystem as cloud service providers, cloud access, cloud data storage, and cloud hardware and software. Section Three covers cloud applications and cloud security, while Section Four presents research topics in cloud computing. Specific topics covered include resource virtualization, resource management and scheduling, and advanced topics like the impact of scale on efficiency, cloud scheduling subject to deadlines, alternative cloud architectures, and vehicular clouds. An included glossary covers terms grouped in several categories, from general to services, virtualization, desirable attributes and security. Includes updated content throughout chapters on concurrency, cloud hardware and software, challenges posed by big data and mobile applications and advanced topics Expanded appendix that presents several cloud computing projects Presents more than 400 references in the text, including recent research results in several areas related to cloud computing Mapuche is the language of the Mapuche (or Araucanians), the native inhabitants of central Chile. The Mapuche language, also called Mapudungu, is spoken by about 400,000 people in Chile and 40,000 in Argentina. The Mapuche people, estimated at about one million, constitute the majority of the Chilean indigenous population. The history of the Mapuche is the story of passionate fighters who managed to stop the Inca's but succumbed to the Spanish invaders after two and a half century of warfare. The relationship of the Mapuche language with other Amerindian languages has not yet been established. Mapuche is a highly agglutinative language with a complex verbal morphology. This book offers a comprehensive and detailed description of the Mapuche language. It contains a grammar (phonology, morphology and syntax), a collection of texts (stories, conversations and songs) with morphological analyses and free translations, and a Mapuche-English dictionary with a large number of derivations and examples. The grammar is preceded by a socio-historical sketch of the Mapuche people and a brief discussion of previous studies of the Mapuche language. The material for the description was collected by the author with the help of five Mapuche speakers with attention to the dialectal differences between them. The abundance of thoroughly analysed examples makes for a lively description of the language. The intricacy of the verbal morphology will arouse the interest not only of those who practice Amerindian linguistics but also of those who are interested in language theory and language typology. General purpose theorem provers provide sophisticated proof methods, and become valuable tools in, e.g. formal software development. Of particular interest here are proof systems with the LCF architecture, developing large theories from a small logical kernel, because this approach simplifies the validation of derived results. On the other hand, such provers often lack some of advanced structuring mechanisms found in specification languages. This thesis firstly gives a formal foundation for a seamless extension of a logical framework by similar mechanisms, and secondly presents an elaborated case study in the LCF-style theorem prover Isabelle, employing the introduced concepts of morphisms and instantiation of theories in-the-large. This thesis proposes a method that plans trajectories for autonomous agents to enable them to fulfil different tasks while ensuring the collision-free movement. The agents are locally controlled and connected over an unreliable communication network that may induce packet losses and transmission delays. Further sensors e.g. for a distance measurement are not used and communication should only be invoked if it is necessary to avoid a collision. The basic problem occurs for two agents. The first agent can change its trajectory at any time without regard to the second agent, which has to ensure the collision avoidance. To this aim it adapts its trajectory based only on local data and communicated information about the current and future movement of the first agent. A control unit for the second agent is introduced that has to execute four tasks to ensure the control aims: 1. Estimation of the current network properties. 2. Prediction of the movement of the stand-on agent. 3. Invocation of communication whenever the local data becomes too uncertain. 4. Planning of collision avoiding trajectories. The main result of the thesis is a novel control method for mobile agents that solves the four tasks leading to a proven collision avoidance. The method consists of a delay estimator, a prediction unit, an event generator and a trajectory planning unit. The method can be used for different types of agents (e.g. UAVs or cars) with only slight modifications. The proposed method is tested and evaluated through simulations and experiments with both, two quadrotors and two nonholonomic robots. A concise but self-contained introduction of the central concepts of modern topology and differential geometry on a mathematical level is given specifically with applications in physics in mind. All basic concepts are systematically provided including sketches of the proofs of most statements.

Smooth finite-dimensional manifolds, tensor and exterior calculus operating on them, homotopy, (co)homology theory including Morse theory of critical points, as well as the theory of fiber bundles and Riemannian geometry, are treated. Examples from physics comprise topological charges, the topology of periodic boundary conditions for solids, gauge fields, geometric phases in quantum physics and gravitation. Written by David Cohen and co-authors Theodore B. Lee and David Sklar, PRECALCULUS, Seventh Edition, focuses on the use of a graphical perspective to provide a visual understanding of college algebra and trigonometry. Cohen's texts are known for their clear writing style and outstanding, graded exercises and applications, including many examples and exercises involving applications and real-life data. Graphs, visualization of data, and functions are introduced and emphasized early on to aid student understanding. One dialect group lives on Graham Island, British Columbia, the other on Prince of Wales Island, Alaska. The recordings on which the book is based were compiled over a period of more than a decade from a wide variety of historical and contemporary sources. Representing the entire range of the Haida musical

tradition—a tradition that nearly died out and is currently being revived—this volume documents its changes over more than a century. Part 1 is a lengthy ethnographic description of musical genres that situates Haida music in the context of the Northwest Coast. Part 2 presents 128 songs, fully transcribed and analyzed and representing some twenty types, ranging from traditional genres such as peace-making and mourning songs to songs of personal expression composed during the modern period. Part 3 is a detailed musical and linguistic analysis of the songs presented in the second part. The integration of descriptions of these two facets of song-music and language is the particular goal of the book. The volume is a substantive contribution to the ethnomusicology of native North America and will be of special interest to scholars concerned with vocabularies in Native American music. John Enrico has been engaged in linguistic research on the Haida language since 1975. His publications include *The Lexical Phonology of Masset Haida* and articles on aspects of Haida grammar. Wendy Bross Stuart's first ethnomusicological publication was *Gambling Music of the Coast Salish Indians*. In 1980 she began collaborating with John Enrico in the transcription and analysis of Haida songs. The history of printing, books, and libraries, is confined only to a limited extent within the boundaries of individual countries. There are, indeed, few historical developments which have played a more universal role, in reaction against all kinds of particularism, than type design, printing, book production, publishing, illustration, binding, librarianship, journal-ism, and related subjects. Their history should be assessed and studied primarily in an international, not in a local, context. The bibliographical resources, however, which the historian of these subjects has at his disposal correspond hardly at all to the essentially international character of the object of his studies. Since the appearance of the retrospective bibliography of BIG MORE and WYMAN, covering the subject comprehensively up to 1880, the only current bibliography has been the *Internationale Bibliographie des Buch- und Bibliothekswesens*. Covering a representative part of newly published literature, it appeared from 1898, but did not survive the Second World War. More recently, several useful, but limited, bibliographies have appeared. *TRANSFER MATRIX METHOD FOR MULTIBODY SYSTEMS: THEORY AND APPLICATIONS* Xiaoting Rui, Guoping Wang and Jianshu Zhang - Nanjing University of Science and Technology, China Featuring a new method of multibody system dynamics, this book introduces the transfer matrix method systematically for the first time. First developed by the lead author and his research team, this method has found numerous engineering and technological applications. Readers are first introduced to fundamental concepts like the body dynamics equation, augmented operator and augmented eigenvector before going in depth into precision analysis and computations of eigenvalue problems as well as dynamic responses. The book also covers a combination of mixed methods and practical applications in multiple rocket launch systems, self-propelled artillery as well as launch dynamics of on-ship weaponry. • Comprehensively introduces a new method of analyzing multibody dynamics for engineers • Provides a logical development of the transfer matrix method as applied to the dynamics of multibody systems that consist of interconnected bodies • Features varied applications in weaponry, aeronautics, astronautics, vehicles and robotics Written by an internationally renowned author and research team with many years' experience in multibody systems *Transfer Matrix Method of Multibody System and Its Applications* is an advanced level text for researchers and engineers in mechanical system dynamics. It is a comprehensive reference for advanced students and researchers in the related fields of aerospace, vehicle, robotics and weaponry engineering. What is this book about? If you want to use Visio to create enterprise software, this is the book for you. The integration of Visual Studio .NET Enterprise Architect and Visio for Enterprise Architects provides a formidable tool. Visio offers powerful diagramming capabilities, including such things as creating UML models, mapping out databases with Entity Relationship diagrams, and aiding the development of distributed systems. Its integration with Visual Studio .NET Enterprise Architect means that C# or Visual Basic .NET code can be generated from the UML diagrams, and Visual Studio .NET projects can be reverse engineered to UML models. For the developer already familiar with UML and looking to get the best out of Visio, the Visual Studio .NET and Visio for Enterprise Architects combination is weakly documented, and the quality information needed to realize the time-saving features of Visio just does not seem to be available, until now. This book presumes that you are already familiar with the basic concepts of UML notation — this book will not teach you UML. Instead, this book will take you forward into the Visio environment, showing you how to make the most of its software related features. What does this

book cover? In this book, you'll learn how to Diagram business components in Visio Generate code from a UML model Reverse engineer Visual Studio .NET projects into a UML model Reverse engineer into a UML model without source code Document the project with UML and Visio Design distributed applications with Visio's diagrams Work with Entity Relationship database modeling, and round-trip engineering for database design This paper aims to reveal the structure of idempotents in neutrosophic rings and neutrosophic quadruple rings. How did the written word serve as an authoritative source in the ancient world? What does it mean that some works became so popular as to merit dedicated interpretive commentaries? And does any direct relationship exist between the various methods of interpretation and styles of composition in these commentaries? The present work sets out to provide some solid answers to such questions. At the heart of this book stands a comparative analysis of ancient cuneiform commentary texts from mid-to-late first millennium Mesopotamia and early Jewish commentaries—known as pesharim—from the turn of the common era found in caves near Khirbet Qumran. Though some aspects of Mesopotamian hermeneutics may have influenced Jewish exegesis, likely through Jewish Aramaic scribes, the actual Mesopotamian

practice of composing commentary texts exerted little-to-no influence on the compositional techniques of the pesharim. Nevertheless, many textual difficulties in the Qumran pesharim can be explained as the result of an accretion of interpretations over an extended period of time—a practice detailed in the textual record of the Mesopotamian commentaries. What is more, these commentaries reveal important evidence about both the way in which and the extent to which such works functioned as authoritative sources. As a result, this book advocates a shift away from discussing textual authority in simple binary terms, both in ancient and modern contexts, to functional descriptions of literary authority. Here are the refereed proceedings of the 9th International Conference on Theory and Practice in Public-Key Cryptography, PKC 2006, held in New York City in April 2006. The 34 revised full papers presented are organized in topical sections on cryptanalysis and protocol weaknesses, distributed crypto-computing, encryption methods, cryptographic hash and applications, number theory algorithms, pairing-based cryptography, cryptosystems design and analysis, signature and identification, authentication and key establishment, multi-party computation, and PKI techniques.
