Histopathology Specimens Oct 22 2022 Covering anatomical, clinical, pathological and laboratory aspects of surgical histopathology specimens, this revised, updated third edition relates specimen dissection and its clinical context to relevant histopathology reports, and therefore a more comprehensive patient prognosis and management is possible. This book explains pathological and clinical terminology, including a glossary of clinical request form abbreviations. A standardised step-wise approach to specimen handling is illustrated with simple line diagrams and highlights essentials of the histopathology report, relating them to appropriate specimen dissection. The integrated multidisciplinary team approach taken to the modern clinical management of patients is reflected by correlating patient presentation, diagnostic and staging investigations with histopathology specimens. Current WHO and TNM tumour classifications are referenced. **Histopathology Specimens: Clinical, Pathological and Laboratory Aspects, Third Edition** will be of educative value and act as a reference tool for the medical undergraduate student, medical trainee in histopathology and the biomedical scientist, and as a useful aide memoire for the histopathology consultant.

Classification in Social Research Nov 18 2019 This important work is addressed to all researchers concerned with classification. It shows the serious limits of the traditional form of analytical classification. The solution it proposes, the inductive population approach, considers all possible cross-classifications in regard to attributes of the phenomena. This approach is theoretically grounded, avoids the tendency to generate excessively abstract constructs, and provides a clear way of linking empirical data with theoretically meaningful attributes of social systems. The last section of the book applies the method to kinship structures.

Contributions Toward a Classification and Biology of the North American Cerambycidae: Larvæ of the Prioninæ (Classic Reprint) Aug 28 2020 Excerpt from Contributions Toward a Classification and Biology of the North American Cerambycidae Larvæ of the Prioninæ Great care is needed in the methods of rearing these larvae. Often a single piece of infested wood will contain from five to a dozen different species of Cerambycidae. It has sometimes occurred that adults and larvae which have been. Found together in the wood have been

wrongly associated by the collector, and the larvae have been preserved in the collection under the name of the adult. As a matter of fact, however, it is more often the case that larvae and adults which have been found together are of different species rather than of the same, because the greater part of a brood of one species generally transforms about the same time. My practice has been to cut the larvae out of the infested wood, separating the species as nearly as possible, and then to cage each larva individually. As the adult emerges the larval skin is preserved for careful comparison with the alcoholic specimens. Many methods have been tried for proper preservation of the material. The most satisfactory for all purposes is to kill the specimens by boiling in water for from 5 to 10 minutes, according to size, and then place them in 75 per cent alcohol. This gives especially good results for anatomical work. Whiter specimens may be had by placing in a mixture of strong alcohol. And a small amount of acetic acid for a few minutes, or by killing in a boiling solution of this mixture. The latter method, however, often interferes with a subsequent study of the muscles. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at www.forgottenbooks.com This book is a reproduction of an important historical work. Forgotten Books uses state-of-the-art technology to digitally reconstruct the work, preserving the original format whilst repairing imperfections present in the aged copy. In rare cases, an imperfection in the original, such as a blemish or missing page, may be replicated in our edition. We do, however, repair the vast majority of

imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.

Automating the Classification of Mosquito Specimens Using Image Processing Techniques
Sep 09 2021 Next, to remove the effect of background noise as well as to concentrate the focus entirely on mosquito anatomy, we designed a framework based on state-of-the-art Mask Region-based Convolutional Neural Networks (Mask R-CNN) to automatically detect and separately extract anatomies of mosquitoes - thorax, wings, abdomen and legs from mosquito images. For this framework, we prepared a training dataset consists of 1500 smartphone images annotated with their mask anatomies across nine mosquito specimens trapped in Florida. In this framework, first, we classify objects of interest (foreground) from the background within the image. Then, we segment pixels containing anatomical components in the foreground by adding a branch to mask (i.e., extract pixels of) that component in the image, and in parallel we add two more branches to localize and classify the extracted anatomical components. The mAP for mask with 0.3, 0.5 and 0.7 IoUs are 0.625, 0.6, and 0.51 for validation dataset. The testing dataset mAP for mask with 0.3, 0.5 and 0.7 IoUs are 0.535, 0.524, and 0.412. Further, we have done feasibility study of anatomy (thorax, wing, abdomen and leg) based classification for genus identification to improve the prediction accuracy for 3 genus category - Aedes, Anopheles and Culex. In this work, we conducted a feasibility study to identify these 3 mosquito genus from their

smartphone images and anatomy-based deep neural network classification model. Very low intraclass variance among these mosquitoes genus and low quality images make this problem more challenging. To overcome this, we employed bilinear CNN architecture for our neural network model that works best in this scenario. we extracted four anatomies (thorax, abdomen, wings and legs) from each mosquito image and trained an independent model for each anatomy for genus classification. We also ensemble these models to compute the aggregated results. Our ensemble and 4 independent anatomy (thorax, abdomen, wing and leg) based model achieved 91%, 87.33%, 81%, 75.80% and 68.02% accuracies respectively on test data.

Forms of Animal Life Jan 13 2022 Forms of animal life - Being outlines of zoological classification based upon anatomical investigation and illustrated by descriptions of specimens and of figures is an unchanged, high-quality reprint of the original edition of 1870. Hanserbooks is editor of the literature on different topic areas such as research and science, travel and expeditions, cooking and nutrition, medicine, and other genres. As a publisher we focus on the preservation of historical literature. Many works of historical

writers and scientists are available today as antiques only. Hansebooks newly publishes these books and contributes to the preservation of literature which has become rare and historical knowledge for the future.

Catalog of Ohio Vascular Plants Jul 07 2021 This work has been selected by scholars as being culturally important, and is part of the knowledge base of civilization as we know it. This work was reproduced from the original artifact, and remains as true to the original work as possible. Therefore, you will see the original copyright references, library stamps (as most of these works have been housed in our most important libraries around the world), and other notations in the work. This work is in the public domain in the United States of America, and possibly other nations. Within the United States, you may freely copy and distribute this work, as no entity (individual or corporate) has a copyright on the body of the work. As a reproduction of a historical artifact, this work may contain missing or blurred pages, poor pictures, errant marks, etc. Scholars believe, and we concur, that this work is important enough to be preserved, reproduced, and made generally available to the public. We appreciate your support of the preservation process, and thank you for being an important part of keeping this knowledge alive and relevant.

Planetary Protection Classification of Sample Return Missions from the Martian Moons Apr 16 2022 An international consensus policy to prevent the biological cross-contamination of planetary bodies exists and is maintained by the Committee on Space Research (COSPAR) of the International Council for Science, which is consultative to the United Nations Committee on the Peaceful Uses of Outer Space. Currently, COSPAR's planetary protection policy does not specify the status of sample-return missions from Phobos or Deimos, the moons of Mars. Although the moons themselves are not considered potential habitats for life or of intrinsic relevance to prebiotic chemical evolution, recent studies indicate that a significant amount of material recently ejected from Mars could be present on the surface of Phobos and, to a lesser extent, Deimos. This report reviews recent theoretical, experimental, and modeling research on the environments and physical conditions encountered by Mars ejecta during certain processes. It recommends whether missions returning samples from Phobos and/or Deimos should be classified as "restricted" or "unrestricted" Earth return in the framework of the planetary protection policy maintained by COSPAR. This report also considers the specific ways the classification of sample return from Deimos is a different case than sample return from Phobos.

Sample Preparation Handbook for Transmission Electron Microscopy Jul 27 2020

Successful transmission electron microscopy in all of its manifestations depends on the quality of the specimens examined. Biological specimen preparation protocols have usually been more rigorous and time consuming than those in the physical sciences. For this reason, there has been a wealth of scientific literature detailing specific preparation steps and numerous excellent books on the preparation of biological thin specimens. This does not mean to imply that physical science specimen preparation is trivial. For the most part, most physical science thin specimen preparation protocols can be executed in a matter of a few hours using straightforward steps. Over the years, there has been a steady stream of papers written on various aspects of preparing thin specimens from bulk materials. However, aside from several seminal textbooks and a series of book compilations produced by the Material Research Society in the 1990s, no recent comprehensive books on thin specimen preparation have appeared until this present work, first in French and now in English. Everyone knows that the data needed to solve a problem quickly are more important than ever. A modern TEM laboratory with supporting SEMs, light microscopes, analytical spectrometers, computers, and specimen preparation equipment is an investment of several million US dollars. Fifty years ago, electropolishing, chemical polishing, and replication methods were the principal specimen preparation methods.

Illustrated Catalogue of a Notable Collection of Beautiful English Furniture of the XVII and XVIII Centuries (Classic Reprint) Oct 30 2020 Excerpt from Illustrated Catalogue of a Notable Collection of Beautiful English Furniture of the XVII and XVIII Centuries HE proper classification of furniture must be based upon a knowledge of form, decoration and material, and the importance of their consideration is in the order named. It is essential that each should be considered in any classification, and it will be the object of this catalogue to place these elements distinctly before the reader in the description of each specimen. The pieces difficult of classification are always those which mark the transition between two distinct styles and it is only by keeping these three elements in mind that a proper classification of such pieces can be made. Allowance must always be made in dating specimens for the fact that styles travel slowly and by the time a London design had reached an outlying point, it would long since have become old - fashioned. This probably accounts for many pieces of early form but of late decoration. The furniture in this collection falls within three well defined groups, covering a period of about two hundred years, and this classification distinctly shows the foreign influences which were molding the English workmen. Writers on English furniture have generally fallen into the habit of classifying specimens after the French fashion, by the name of the sovereign under whom

the style developed, such as Charles II, William and Iviary, and Queen Anne. While in France such distinctions were proper and in the main accurate, in England no such classification can be made without causing confusion, for in the latter country the sovereigns have never been patrons of art, nor does the furniture represent any national art, strictly speak ing. For instance, the style called Queen Anne did not really come into favor until the reign of George II. The truth is, that the English artisan was not an originator, but an adapter, and this is not said by way of disparagement, for English adaptations of Continental styles were often superior to their prototypes, in that they developed a style along practical lines until it had become distinctly English. Llewelyn Williams, Assorted Notes and Specimen Lists Apr 23 2020 Field notes Vol. 392 contains assorted alphabetical and numerical listings of specimens collected by Llewelyn

Williams. Pages are in disarray and loosely placed in a spiral binder, likely not in any kind of original order. Pages include: 64-page typewritten list of specimens, alphabetical by scientific name with specimen numbers; 56-page typewritten list of common names of Mexican plants from the Isthmus of Tehuantepec, alphabetical by common name with scientific name and specimen numbers; a typewritten list of specimen numbers 8260-9926; a handwritten list of specimen numbers 268-391, collected in 1938 in Venezuela; a mix of typewritten and handwritten notes for lesson plans on plant classification, in Spanish; and many additional lists of specimen numbers in disarray, mostly unclear as to collection dates and locations, possibly South and Central America locations.

Type Faces with Specimens Jan 25 2023

The Classification of Sex Jun 06 2021 Alfred C. Kinsey's revolutionary studies of human sexual behavior are world-renowned. His meticulous methods of data collection, from comprehensive entomological assemblies to personal sex history interviews, raised the bar for empirical evidence to an entirely new level. In *The Classification of Sex*, Donna J. Drucker presents an original analysis of Kinsey's scientific career in order to uncover the roots of his research methods. She describes how his enduring interest as an entomologist and biologist in the compilation and organization of mass data sets structured each of his classification projects. As Drucker shows, Kinsey's lifelong mission was to find scientific truth in numbers and through observation—and to record without prejudice in the spirit of a true taxonomist. Kinsey's doctoral work included extensive research of the gall wasp, where he gathered and recorded variations in over six million specimens. His classification and reclassification of Cynips led to the speciation of the genus that remains today. During his graduate training, Kinsey developed a strong interest in evolution and the links between

entomological and human behavior studies. In 1920, he joined Indiana University as a professor in zoology, and soon published an introductory text on biology, followed by a coauthored field guide to edible wild plants. In 1938, Kinsey began teaching a noncredit course on marriage, where he openly discussed sexual behavior and espoused equal opportunity for orgasmic satisfaction in marital relationships. Soon after, he began gathering case histories of sexual behavior. As a pioneer in the nascent field of sexology, Kinsey saw that the key to its cogency was grounded in observation combined with the collection and classification of mass data. To support the institutionalization of his work, he cofounded the Institute for Sex Research at Indiana University in 1947. He and his staff eventually conducted over eighteen thousand personal interviews about sexual behavior, and in 1948 he published *Sexual Behavior in the Human Male*, to be followed in 1953 by *Sexual Behavior in the Human Female*. As Drucker's study shows, Kinsey's scientific rigor and his early use of data recording methods and observational studies were unparalleled in his field. Those practices shaped his entire career and produced a wellspring of new information, whether he was studying gall wasp wings, writing biology textbooks, tracing patterns of evolution, or developing a universal theory of human sexuality.
